12.13.1.10

QUESTION:Given that the two numbers appearing on throwing two dice are different.Find the probability of the event 'the sum of numbers on the dice is 4'.
ANSWER:$\frac{1}{15}$
SOLUTION:Let S be the sample space of the event.

$$S = \begin{bmatrix} (1,1) & (2,1) & (3,1) & (4,1) & (5,1) & (6,1) \\ (2,1) & (2,2) & (3,2) & (4,2) & (5,2) & (6,2) \\ (3,1) & (2,3) & (3,3) & (4,3) & (5,3) & (6,3) \\ (4,1) & (2,4) & (3,4) & (4,4) & (5,4) & (6,4) \\ (5,1) & (2,5) & (3,5) & (4,5) & (5,5) & (6,5) \\ (6,1) & (2,6) & (3,6) & (4,6) & (5,6) & (6,6) \end{bmatrix} \tag{1}$$

n(S)=36
Let Y be the random variable represents the outcome of a die.

$$p_Y(n) = \begin{cases} \frac{1}{6} & 1 \le n \le 6 \\ 0 & otherwise \end{cases} \tag{2}$$

Let X be a random variable represents the event "the sum of numbers on the dice".
Let X_1, X_2 represents the numbers on each dice respectively.

Parameter	Value	Description
X	{2,3,4,........,12}	Sum of the numbers on two dice
X1	{1,2,3,4,5,6}	Number on die 1
X2	{1,2,3,,4,5,6}	Number on die 2

TABLE 0
DEFINITIONS

$$X = X_1 + X_2 \tag{3}$$
$$X = \{1, 2, 3, \dots, 12\} \tag{4}$$
$$p_X(n) = \Pr(X_1 + X_2 = n) = \Pr(X_1 = n - X_2) \tag{5}$$
$$= \sum_k \Pr(X_1 = n - k | X_2 = k)\, p_{X_2}(k) \tag{6}$$

X_1 and X_2 are independent.

$$\Pr(X_1 = n - k | X_2 = k) = \Pr(X_1 = n - k) = p_{X_1}(n - k) \tag{7}$$

$$p_X(n) = \sum_k p_{X_1}(n-k) p_{X_2}(k) \tag{8}$$

$$p_x(n) = \frac{1}{6} \sum_{k=1}^{6} p_{X_1}(n-k) = \frac{1}{6} \sum_{k=n-6}^{n-1} p_{X_1}(k) \tag{9}$$

$$\because p_{X_1}(k) = 0, k < 1, k > 6. \tag{10}$$

From (9)

$$p_X(n) = \begin{cases} 0 & n < 1 \\ \frac{1}{6} \sum_{k=1}^{n-1} p_{X_1}(k) & 1 \le n - 1 \le 6 \\ \frac{1}{6} \sum_{k=n-6}^{6} p_{X_1}(k) & 1 < n - 6 \le 6 \\ 0 & n > 12 \end{cases} \tag{11}$$

Substituting (2) in (11)

$$p_X(n) = \begin{cases} 0 & n < 1 \\ \frac{n-1}{36} & 2 \le n \le 7 \\ \frac{13-n}{36} & 7 < n \le 12 \\ 0 & n > 12 \end{cases} \tag{12}$$

Here n=4,

$$p_X(4) = \frac{3}{36} \tag{13}$$

Given that $X_1 \neq X_2$

$$(X_1 = X_2) = \{(1,1),(2,2),(3,3),(4,4),(5,5),(6,6)\} \tag{14}$$

$$n(X_1 = X_2) = 6 \tag{15}$$

$$\Pr(X_1 \neq X_2) = 1 - \Pr(X_1 = X_2) \tag{16}$$

$$From(15) \tag{17}$$

$$= 1 - \frac{6}{36} \tag{18}$$

$$= \frac{30}{36} \tag{19}$$

$$(X = 4) \cap (X_1 \neq X_2) = \{(1,3),(3,1)\} \tag{20}$$

$$n((X = 4) \cap (X_1 \neq X_2)) = 2 \tag{21}$$

$$\Pr((X = 4) \cap (X_1 \neq X_2)) = \frac{2}{36} \tag{22}$$

Sum	Numbers(X_1, X_2)
4	(1,3)
4	(3,1)

TABLE 0
VALUES SATISFYING GIVEN CONDITION

Hence required probability is,

$$\Pr((X = 4)|(X_1 \neq X_2)) = \frac{\Pr((X = 4) \cap (X_1 \neq X_2))}{\Pr(X_1 \neq X_2)} \tag{23}$$

Substituting (19) and (22) in (23)

$$\Pr((X = 4)|(X_1 \neq X_2)) = \frac{\frac{2}{36}}{\frac{30}{36}} = \frac{2}{30} = \frac{1}{15} \tag{24}$$
